Your judgement is better than mine in deciding whether or not there really is motivation to put the peices together, since you have read the references and I have not. If you, in your scientist role, sat down with the references, would it have occurred to you to put them together to get the invention, if you did not already know about the invention? If the invention is not a method of cancer treatment, is there an enablement issue on how to use the claimed invention for purposes other than treating cancer?

Sorry for the socratic response, but I really can't substitute my ignorance for your judgement. MM

09765086

There are 3 sets of method claims using a chimeric construct consisting of two parts (one. prostate-targeting peptide and the other, lyis-causing anti-microbial peptide).

The first set of claim says "a method of directing an antimicrobial peptide in vivo to prostate tissue";

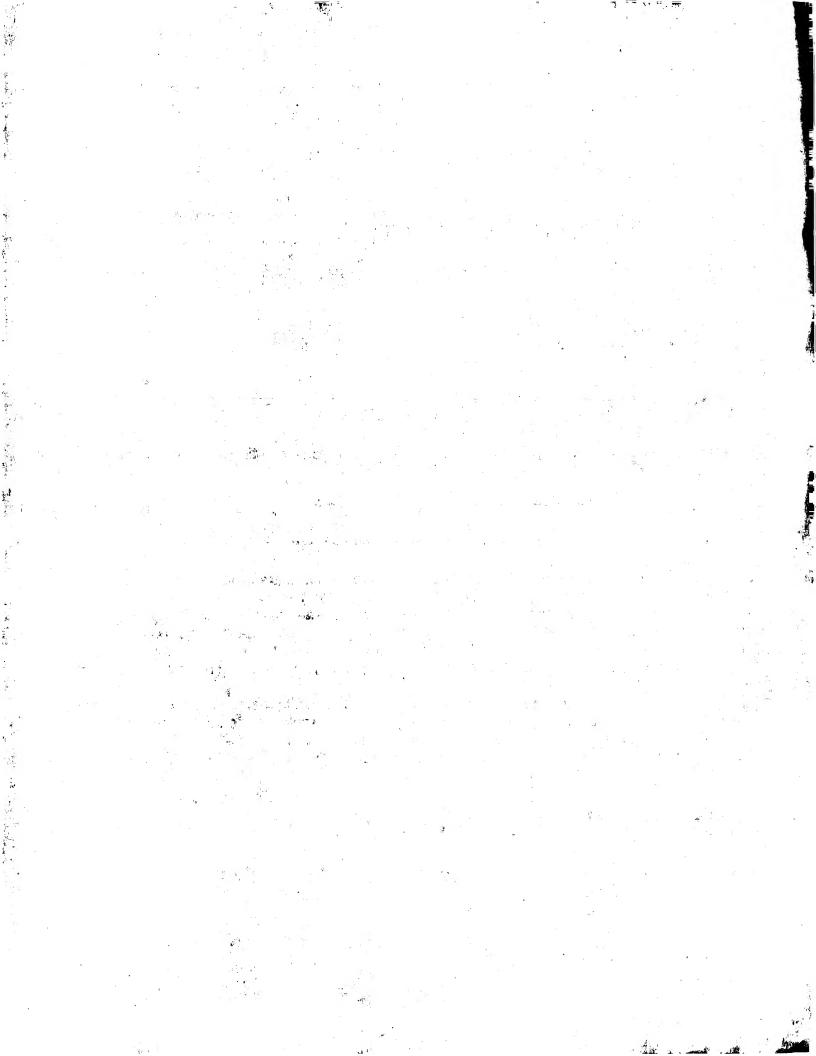

The second set of claims says "a method of inducing apoptosis in prostate tissue in vivo"; and

The third set of claims says "a method of selectively inducing apoptosis in normal prostate tissue"

The first and second sets were rejected by combination of primary reference showing prostatetargeting peptides are known in the art to direct cancer treating agents to prostate, by two types of secondary reference showing that there is a need in the prostate cancer treatment art for a method to reduce generalized side effects, and antimicrobial peptide has been used for cancer treatment. Combination of the primary and secondary references teach all necessary components of the products for directing something to prostate or inducing apoptosis in prostate.

In reply to OA, applicant argues that their invention is not drawn to method of cancer treatment and there is no motivation why one in ordinary skill would be motivated to do the purpose specified in the preamble of the claims. The most of the specification is about prostate cancer treatment using the chimeric product. Do I drop the rejection?

Examiner Misook Yu. Ph.D. 703-308-2454 (Phone) Art Unit 1642 CM1-8E18 (Room) CM1-8E12 (Mail Box)

                                                                          The present invention relates to homing pro-apoptotic conjugates, comprising of a tumour homing molecule that selectively homes to a mammalian cell type or tissue, linked to an antimicrobial peptide. The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to angiogenic vasculature. The antimicrobial peptide has low mammalian cell toxicity when not linked to the tumor homing molecule. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and

                                                                                                                            The patent discloses novel chimeric prostate-homing pro-apoptotic peptide which comprises a prostate-homing peptide linked to an antimicrobial peptide, where the chimeric peptide is selectively internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate-homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is mouse prostate homing peptide. This sequence is useful in the homing of pro-apoptotic
                                                                                                                                                                                                                                                    Claim

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-I- MISCELLANEOUS: EUKARYOTIC TOPOISOMERASE I AND II CAN RELAX BOTH NESCETIVE AND POSITIVE SUPERCOILS, WHEREAS PROKARYOTIC ENZYMES RELAX ONLY NEGATIVE SUPERCOILS.

-I- MISCELLANEOUS: WHEN A TOPOISOMERASE TRANSIENTLY BREAKS A DNA BACKBONE BOND, IT SIMULTANEOUSLY FORMS A PROTEIN-DNA LINK, IN WHICH A TYROSYL OXYGEN IN THE ENZYME IS JOINED TO A DNA PHOSPHORUS AT ONE END OF THE ENZYME-SEVERED DNA STRAND.

-I- SIMILARITY: BELONGS TO THE EUKARYOTIC TYPE I TOPOISOMERASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                        TOP1_DAUCA P93119;
                                                                                                                -I- FUNCTION: THE REACTION CATALYZED BY TOPOISOMERASES LEADS TO THE CONVERSION OF ONE TOPOLOGICAL ISOMER OF DNA TO ANOTHER.
-I- CATALYTIC ACTIVITY: ATP-INDEPENDENT BREAKAGE OF SINGLE-STRANDED
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          REPEAT

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 5856178
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: White Phb, Wanneth
APPLICANT: Reed, William
TITLE OF INVENTION: Cassette for Expression of Lytic
TITLE OF INVENTION: Peptides in Mammalian Transgenic Organisms
NUMBER OF SEQUENCES: 3
CORRESPONDENCE ADDRESS:
ADDRESSEE: Trask Britt and Rossa

Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
